

4. Create a Form with Different Input Types

Write an HTML document that contains a form with the following elements:

- A text input for the user's name.
- An email input.
- A password input.
- A radio button group for gender (Male, Female, Other).
- A submit button.

5. Write an HTML document that contains a nested list structure. The document should include:

1. An ordered list with four items.
2. Each item in the ordered list should contain an unordered list with three items.
3. Each item in the unordered list should also contain a small paragraph of text.

6. Write an HTML document that contains a form structured within a table. The form should include:

1. A table with two rows and two columns.
2. The first row should contain a text input for the user's name and a text input for the user's email.
3. The second row should contain a textarea for comments and a submit button.

7. Create a Complex Form Layout with Nested Tables and Lists

Write an HTML document that contains a form structured within a nested table layout. The form should include:

1. A main table with two rows and two columns.
2. The first row should have:
 - A nested table in the first cell with three rows and two columns, including:
 - Text input for the user's first name and last name.
 - A select dropdown for the user's country.
 - An unordered list in the second cell with at least three items.
3. The second row should have:
 - A text area for comments in the first cell.
 - A submit button and a reset button in the second cell.
